Project Controlling in an Agile World

REFERENT
Frank Schlosser
Senior Enterprise Architect

ABSTRACT
Most organizations are transforming their IT project organization from traditional waterfall to agile methodologies like Scrum. While this makes software development more flexible and responsive to rapidly changing requirements it significantly impacts the way projects are controlled. In this guest lecture we look at common challenges organizations are facing when adapting their IT controlling to account for agile approaches, and we will also discuss how IT projects can be effectively controlled in client/vendor relationships.
